DETAILED ACTION

It is noted that that prior art mentioned in the specification have been considered, US 6,159,810, 5,278,096, and 5,464,789. However, there was no IDS form (PTO-1449) enclosed in the file.

Specification

1. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

3. Claims 1-3 and 7-10 are rejected under 35 U.S.C. 102(a) as being anticipated by Yang, US 6,159,810.

In regard to claim 1, in figs 4-12, Yang discloses a method of making a dual work function gate electrode of a CMOS semiconductor structure, the improvement comprising formation of the dual work function gate electrode comprising:

a) forming a gate oxide layer 23 over a channel of a nMOS site and over a channel of a pMOS site;

b) forming an undoped polysilicon layer 33 over said gate oxide layer;

c) masking said pMOS site, forming an a-Si layer over said nMOS site using a first heavy ion implantation, and implanting arsenic solely into said a- Si layer;

d) masking said nMOS site formed by step c), forming an a-Si layer over said pMOS site using a second heavy ion implantation, and implanting boron solely into said a -Si regions;

e) laser annealing said nMOS and pMOS sites for a sufficient period of time and at an energy level sufficient to melt at least a portion of the a- Si but insufficient to melt the polysilicon; and

f) affecting cooling after laser annealing to convert a- Si into polysilicon without gate oxide damage; see also cols. 4-5.

In regard to claims 2-3 and 7-10, the method of claim 1 wherein in step c), said first

heavy ion implantation is affected by selecting a material from the group consisting of Ge or Si; see col. 4, lines 47-52.

Allowable Subject Matter

4. Claims 4-6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
